TrueGuard AI Battlecard

Drawbridge – TrueGuard AI

Headline positioning

Cyber due diligence has traditionally been built on a “trust” model.

TrueGuard AI transforms that model into “trust but verify.”

Instead of relying on annual questionnaires and attestations, TrueGuard continuously validates whether the cybersecurity controls a firm reports are actually operating across its environment.

This changes cyber due diligence from a static compliance exercise into a dynamic verification process.

Target buyer

COOs, CTOs, CISOs and risk/compliance leaders at:

- Hedge funds
- Private equity firms
- LPs and institutional investors
- Alternative investment firms responding to ODD and investor cyber due diligence.

These buyers are responsible for demonstrating credible cyber maturity to investors, regulators and counterparties.

Core issues

Cyber due diligence across the alternative investment industry still relies heavily on manual questionnaires and annual attestations.

Firms struggle with several persistent challenges:

- Cyber DDQs rely on self-reported answers that are rarely validated.
- Evidence gathering for investor questionnaires is time consuming and manual.
- Security tools operate in silos, creating fragmented visibility.
- Firms cannot easily prove that their controls are actually functioning as intended.
- Due diligence responses quickly become outdated after submission.

As a result, cyber due diligence often becomes an exercise in documentation rather than verification.

The Drawbridge Solution: TrueGuard AI

TrueGuard AI is an AI-powered platform that continuously validates cyber controls against real operational data.

Rather than simply identifying potential risks, TrueGuard verifies whether the controls a firm claims to have in place are actually functioning across its environment.

TrueGuard AI does this by integrating multiple Drawbridge security services including:

- Network scanning
- Endpoint scanning
- Cloud assessments
- Penetration testing
- Security policies and training data.

The platform uses AI agents to compare cyber due diligence responses with the real-world signals coming from a firm's environment.

It automatically identifies discrepancies such as:

- Security controls reported but not implemented
- Vulnerabilities visible across endpoints or networks
- Missing training participation
- Inconsistent policy documentation
- Configuration gaps across infrastructure.

The result is a continuously validated cyber posture, not a once-a-year snapshot.

Why this solution matters for alternative investment firms

TrueGuard fundamentally changes the cyber due diligence process.

Instead of manually answering questionnaires once a year, firms gain a continuously verified view of their cyber maturity.

This allows firms to:

- Continuously validate cyber controls against real-time operational data
- Provide greater transparency to investors and allocators
- Detect gaps between policy and reality before investors do

- Reduce the time and cost associated with ODD questionnaires.

For investment firms, this turns cyber due diligence into a credible, defensible and continuously updated process.

The Drawbridge Differentiator

Integrated cybersecurity ecosystem

TrueGuard leverages Drawbridge's existing suite of services already deployed across many client environments.

Because these tools are already collecting data, TrueGuard can unify them into a single verification layer.

AI-driven control validation

TrueGuard uses AI to reason across multiple data sources and detect discrepancies without needing rigid rule sets.

This allows the system to identify gaps across technical systems, policies and operational processes.

Built for the alternative investment industry

TrueGuard is designed specifically around the cyber due diligence process used by hedge funds, private equity firms and allocators.

Massive data footprint

Drawbridge already services 1,300+ firms across the alternative investment ecosystem, providing the scale and deployment footprint necessary for this model to work.

Independent provider

TrueGuard is delivered by an independent cybersecurity firm, ensuring credibility with investors and regulators.

Proof points to reinforce confidence

- Built on Drawbridge's ecosystem of 1,300+ alternative investment clients
- Integrates multiple Drawbridge cybersecurity services already deployed in client environments

- Transforms cyber due diligence from annual attestation to continuous verification
- Provides investors with greater transparency and confidence in cyber posture.

Objection handling

"We already complete cyber DDQs for investors."

Most DDQs are still based on static, self-reported responses.

TrueGuard enables firms to automatically answer many of those questions and continuously validate them against real operational data.

"We already have security tools in place."

TrueGuard does not replace those tools.

It integrates and analyzes the outputs from multiple security services to verify that controls are actually working as intended.

"This sounds complex to implement."

TrueGuard is built on top of the existing Drawbridge service ecosystem already deployed across many clients.

For firms already using Drawbridge services, the platform can be activated with minimal disruption.

"We already monitor cyber risk internally."

Internal monitoring focuses on identifying threats.

TrueGuard focuses on validating the controls firms claim to have in place, which is what investors and ODD teams are ultimately assessing.

"Why do we need this if we already passed due diligence?"

Passing a due diligence review once does not guarantee that controls remain effective.

TrueGuard continuously verifies cyber controls so firms can confidently stand behind their responses year-round.

"If TrueGuard can validate my questions, can it answer my due diligence questionnaire automatically so I don't have to answer them manually every year?"

Many (though not all) due diligence questions can be answered using insights TrueGuard AI continuously learns from a client's environment. As the platform evolves and coverage expands, future releases will enable clients to auto-populate point-in-time DDQs for CRAs using these validated insights.

TrueGuard will then continue to monitor each control on an ongoing basis - replacing static, annual responses with continuous assurance.

Sales positioning line (internal use)

Traditional cyber due diligence asks: ***"Do you have this control?"***

TrueGuard asks: ***"You said you have this control - is it actually operating across your environment right now?"***
